

The Core Problem

Property reviews are rich, but inconsistent. Expedia lacks a systematic way to identify data gaps or areas needing refreshed information about a property.

Common Pain Points:

- Some topics are over-covered; important details are missing
- Information becomes stale — amenities, policies, and renovations change
- Updates come reactively from suppliers, not proactively from reviewers
- Static prompts ask for things Expedia already knows (i.e., “how great the pool is”)

What You’re Building

Build a prototype that:

- Identifies missing or outdated property information from review data
- Generates 1–2 personalized, targeted questions per reviewer
- Supports both text and voice input — reducing friction for users
- Enriches Expedia’s property knowledge base with fresh, structured insights

Goal:

Capture useful information while minimizing user effort.

Multimodality!

What You’re Building

Build a prototype that:

- Identifies missing or outdated property information from review data
- Generates 1–2 personalized, targeted questions per reviewer
- Supports both text and voice input — reducing friction for users
- Enriches Expedia’s property knowledge base with fresh, structured insights

Goal:

Capture useful information while minimizing user effort.

What Strong Solutions Look Like

Strong solutions demonstrate:

- Intelligent gap detection — knows what's missing, not just what's been said
- Relevant and targeted questions — 1–2 per user, specific to the property and stay
- Low-friction interaction — voice or text, quick to complete
- Clear reasoning — why this question, why now, for this property?

Complexity alone does not win.

A simple system that asks the right question at the right time will outperform a technically impressive one that misses the point.
